Deep Query Ask - Case Management

Project Overview

Project Name: Customer Support Case Management

Salesforce Cloud Used: Service Cloud

Role Focus: Salesforce Business Analyst

The organization wants to modernize and standardize how customer complaints and support requests are handled by implementing Salesforce Service Cloud as a centralized support system.

Encountering Challenges in Understanding Client Requirements

Problem Statement (AS-IS State)

The company currently manages customer support requests in a manual and unstructured manner using emails, phone calls, and Excel sheets. There is no centralized system to track customer complaints, resulting in delayed responses, inconsistent follow-ups, and poor visibility into case status.

Support agents lack a structured workflow, and management has no real-time insights into service performance. This negatively impacts customer satisfaction and operational efficiency.

AS-IS Business Issues

Customer complaints received via email and phone calls

Support team manually tracks cases in spreadsheets

No centralized case management system

No SLA tracking or escalation process

Customers repeatedly follow up for status updates

No visibility into open or overdue cases

Difficult to measure agent workload and performance

No historical data for audits or analysis

Business Impact (AS-IS)

Delayed case resolution

Poor customer experience and satisfaction

Increased workload for support agents

Inconsistent handling of customer issues

No performance metrics for management

Decisions based on assumptions instead of data

Risk of SLA breaches and compliance issues

Business Objectives (TO-BE State)

The objective of this project is to implement Salesforce Service Cloud to standardize and automate customer support operations.

Key Objectives

Capture all customer complaints in a single system

Automate case creation and assignment

Track case lifecycle from creation to closure

Monitor SLAs and resolution timelines

Improve communication with customers

Provide real-time visibility through reports and dashboards

Measure agent productivity and service quality

Improve overall customer satisfaction

Scope Definition (BA View)

In Scope (Salesforce)

Case creation (Email-to-Case / Web-to-Case)

Case assignment rules

Case lifecycle management
SLA tracking using Entitlements
Case escalation rules
Reports and dashboards

Out of Scope

Telephony (CTI) integration
Chatbot or AI-based support
ERP or billing system integration
Knowledge base automation (optional future phase)

AS-IS vs TO-BE Comparison

Area	AS-IS	TO-BE
Case Tracking	Excel & Emails	Salesforce Cases
Assignment	Manual	Automated
SLA Tracking	Not available	Salesforce Entitlements
Customer Updates	Manual follow-ups	Automated notifications
Reporting	None	Real-time dashboards
Agent Performance	Not measurable	Data-driven metrics

TO-BE Process Flow (Future State)

Customer submits issue via email or web form
Case is automatically created in Salesforce
Case is assigned to the appropriate support agent
Agent works on the case and updates status
Customer receives status notifications

SLA is monitored throughout the lifecycle

Case is resolved and closed

Management reviews reports and dashboards

Data Model (Logical – BA View)

Core Salesforce Objects Used

Object	Purpose
Account	Represents customer organization
Contact	Represents customer individual
Case	Tracks customer complaints/support requests
Case Comment	Stores communication updates
Case History	Tracks status and ownership changes
Entitlement	Defines SLA rules
Case Milestone	Tracks SLA milestones
User	Support agents

Data Relationships

- Account → Contact
- Account → Case
- Contact → Case
- Case → Entitlement
- Case → Case Milestones

Milestone Breakdown (BA-Driven) :

Milestone Breakdown (BA-Driven) is a structured approach used by a Salesforce Business Analyst to divide a project into logical, manageable phases based on business goals rather than technical implementation steps.

Each milestone represents a business outcome that the Salesforce solution must achieve. The Business Analyst defines what needs to be accomplished at each stage, why it is needed from a business perspective, and how success will be measured. Technical teams (Admins/Developers) then implement the solution based on these defined milestones.

1. Business Requirements Document (BRD)

BRD 01: Centralized Case Repository - The system must provide a single, centralized platform in Salesforce to log and track all customer issues, eliminating the use of disparate Excel sheets.

BRD 02: Multi-Channel Ingestion - The system must automatically capture incoming customer support requests submitted via email and web forms to create cases.

BRD 03: Automated Routing & Assignment - The platform must automatically route and assign cases to specific support agents or queues based on preset criteria (e.g., issue category or priority).

BRD 04: Structured Agent Workspace - Support agents must have a unified workspace to view customer history, update case statuses, and log internal notes.

BRD 05: Customer Status Notifications - The system must automatically trigger status update notifications to customers at key milestones of their case lifecycle.

BRD 06: SLA & Milestone Tracking - The organization must be able to define, track, and monitor Service Level Agreements (SLAs) for initial response and final case resolution times.

BRD 07: Real-Time Reporting & Dashboards - Management must have access to real-time dashboards tracking team performance, open case volumes, and bottleneck areas.

BRD 08: Escalation Management - The system must automatically flag or escalate high-priority or stagnant cases that breach defined SLA thresholds

BRD 09: Role-Based Security - Access to sensitive customer data and case modification privileges must be restricted based on user roles and profiles.

BRD 10: Audit Trail & History Tracking - The system must maintain a comprehensive history log of all changes made to a case for compliance and quality auditing.

2. Functional Requirements Document (FRD)

RD 01: Email-to-Case / Web-to-Case Setup - Configure Salesforce Email-to-Case and Web-to-Case services to map incoming fields (Subject, Description, Web Email) directly to standard Case fields.

FRD 02: Standard & Custom Object Layouts - Customize the Case page layout to display essential sections such as Details, Related Contacts, Milestones, and Activity history.

FRD 03: Case Assignment Rules - Build and activate Case Assignment Rules to evaluate criteria upon record creation and route cases to designated queues.

FRD 04: Salesforce Service Console - Implement the Lightning Service Console app, enabling tabbed multi-tasking and split views for support agents.

FRD 05: Record-Triggered Flows for Notifications - Develop declarative Flows to automatically send email templates to customers when a case status changes or gets resolved.

FRD 06: Entitlement Processes & Milestones - Configure Business Hours, Entitlement Processes, and Milestones to track First Response and Resolution time targets.

FRD 07: Validation Rules - Implement validation rules (e.g., preventing a case from moving to "Closed" without a resolution note filled out).

FRD 08: Custom Reports & Folder Structure - Create standard report types for Cases with/without Milestones and build executive folders for leadership dashboards.

FRD 09: Sharing Settings & Profiles - Set Case object sharing to Private, and configure sharing rules or queue memberships to control record visibility.

FRD 10: Quick Actions & Macros - Configure pre-defined quick actions and macros to allow agents to send standard responses and update statuses in a single click.

Milestone 1 : Salesforce BA Foundation (Account & Navigation)

Introduction

Salesforce—not to code, but to understand business data, processesAre you new to Salesforce and the Business Analyst role? Not sure how Salesforce supports business processes or where a BA should start? This milestone introduces Salesforce from a Business Analyst perspective. You will learn what Salesforce is, how to access it, and how a BA explores processes, and users

What Is Salesforce? (BA Perspective)

Salesforce is a customer success platform that helps organizations

- Manage customer data
- Automate business processes
- Improve sales and service efficiency
- Provide insights through reports and dashboards

As a Salesforce Business Analyst, your role is to:

- Understand business needs
- Map them to Salesforce features
- Ensure Salesforce supports business outcomes

Milestone Objective (For BA)

By the end of this milestone, students will

- Create a Salesforce Developer account
- Access Salesforce Setup
- Understand Salesforce UI from a BA point of view
- Identify where business data and processes live

Activity 1: Creating Developer Account:

Creating a developer org in Salesforce. 1. Go to

<https://developer.salesforce.com/signup>

2. On the sign-up form, enter the following details:

- 1) First name & Last name
- 2) Email
- 3) Job Title: Developer
- 4) Company: College Name
- 5) Country: India

Click on sign me up after filling these.

Activity 2: Account Activation

1. Go to the inbox of the email that you used while signing up. Click on the verify account to activate your account. The email may take 10-30mins and sometimes 2 hours.

2. Click on Verify Account
3. Give a password and answer a security question and click on change password.

Change Your Password

Enter a new password for **lead@sb.oom**.
Make sure to include at least:

- ✓ 8 characters
- ✓ 1 letter
- ✓ 1 number

* New Password

..... Good

* Confirm New Password

..... Match

Security Question

▼ In what city were you born?

* Answer

asdfghjkl

Change Password

4. Then you will redirect to your salesforce setup page

Milestone 2: Salesforce Service Cloud Foundation

Objective:

Understand Service Cloud features and navigation from a BA perspective

BA Activities

- Understand Case object
- Identify support process requirements
- Review standard Service Cloud capabilities

Deliverable

- Process understanding document

Milestone 2: Case Object & Fields Objective: Ensure required business data is captured. BA Activities

- Identify required case fields:
 - Case Type
 - Priority
 - Status
 - Origin
 - Description
- Define picklist values

Case Information

* = Required Information

Case Owner: Usha Sankhla

Case Number: [Empty]

Contact Name: Usha Sankhla

Account Name: Search Accounts...

Type: Mechanical

Case Reason: Installation

* Status: New

Priority: Medium

* Case Origin: Email

Web Information

Web Email: ☐ Assign using active assignment rule

Web Company: [Empty]

Web Phone: [Empty]

Web Name: ☐ Send notification email to contact

Buttons: Cancel, Save & New, Save

Milestone 3:

Case Creation Channels Objective:
Capture cases from multiple channels

. BA Activities

- Define case intake channels:
 - Email-to-Case
 - Web-to-Case
- Define default values and ownership

Email-to-Case

After you configure your Email-to-Case settings, add routing addresses. Each routing address is an existing email address that your customers can use to submit cases to your support team. Emails automatically convert to cases based on the routing address's settings.

⚠ Salesforce now sends emails only from verified domains. To avoid delivery failures, verify your email domains or enable your substitute email-sending domain. [Learn More](#)

Settings

After you enable Email-to-Case, you can't disable it, but you can update its settings.

Enable Email-to-Case ☒

Notify case owners on new emails ☒

Let agents receive emails ☒

Enable HTML email ☒

Set case source to email ☒

Save Email-to-Case attachments as Salesforce files ☒

Include triggers on status change from lead to lead ☒

Reply with new content only ☒

Send Emails from Cases

Send emails via external services ☒

Insert email threading token in email subject ☒

Insert email threading token in email body ☒

Use email headers for threading ☒

Place user signatures before email threads ☒

On-Demand Service

Let Salesforce handle incoming emails for you. The Email-to-Case on-demand service converts customer emails into cases or adds them to existing cases.

Create on-demand service ☒

Choose how Email-to-Case handles emails that surpass your organization's daily email processing limit or emails from blocked senders.

Over email rate limit action: Unsubscribed sender action ☒ Bounce message ☒ Discard message ☒

Let Salesforce notify email senders when there's an error during Email-to-Case processing.

Notify senders about Email-to-Case processing errors ☒

Routing Addresses

Milestone 5 : DATA SECURITY MODEL

The Data Security Model in Salesforce is a framework that controls who can see, access, and modify data in an organization. It ensures that the right users have the right level of access to records while protecting sensitive information.

Milestone 6 : Creating Assignment Rule

Ensure that every incoming customer case is automatically routed to the correct support agent or support queue based on defined business rules. This helps reduce response time, balance workload, and improve customer satisfaction.

Why This Milestone Is Important (BA Context)

Without assignment rules:

- Cases may remain unassigned
- High-priority cases may be delayed
- Agents may be overloaded while others are idle
 - SLA breaches may occur Assignment rules ensure right case → right agent →

right time.

Objective:

Ensure cases are routed correctly.

BA Activities

- Define assignment logic: ○ Based on Case Type ○ Based on Priority
- Validate workload distribution Deliverable
- Case assignment rules document.

Setup Home Object Manager

Search Setup

Case Assignment Rules

New Case Assignments

Add rule entries that specify the criteria used to route cases. You can reorder rule entries on this page after you create them.

Rule Detail

Action	Order	Criteria	Assign To	Email
Edit Del	1	(Case: Case Origin EQUALS Email) AND (Case: Case Origin EQUALS Web)	Tier 1 Support	✓

Queue Edition

Search Setup

Queues

Queues allow groups of users to manage a shared workload more effectively. A queue is a location where records can be routed to await processing by a group member. The records remain in the queue until a user accepts them for processing or they are transferred to another queue. You can specify the set of objects that are supported by each queue, as well as the set of users that are allowed to retrieve records from the queue.
